# CASE CLASSIFICATION & SEVERITY ANALYSIS

**Task 4**

| Case | Drug | Adverse Reaction | Seriousness | Expectedness |
|---|---|---|---|---|
| **01** | Azithromycin | Nausea and vomiting | Non-Serious | Expected |
| **02** | Diclofenac | Peptic ulcer bleeding requiring hospitalization | Serious | Expected |
| **03** | Carbamazepine | Stevens-Johnson syndrome (SJS) | Serious | Unexpected |
| **04** | Amlodipine | Ankle swelling (peripheral oedema) | Non-Serious | Expected |
| **05** | Ciprofloxacin | Tendon rupture | Serious | Expected |

| Final Answer | Final Summary |
|---|---|
| **Case 1 - Non-serious and expected.** | 1 (Expected) = 5 cases – Case 1,2,3,4,5 |
| **Case 2 - Serious and expected.** | 2 (Unexpected) = 0 case - none |
| **Case 3 - Serious and unexpected** | 3 (Serious) = 3 cases - Case 2, 3, 5 |
| **Case 4 - Non-serious and expected.** | 4 (Non-Serious) = 2 cases - Case 1, 4 |
| **Case 5 - Serious and expected.** | Serious and expected. |

**Observations** - 1. Azithromycin: Nausea and vomiting are known adverse reactions of azithromycin. Hence, they are classified as Expected and Non-Serious.

2. Diclofenac: Gastrointestinal ulceration and bleeding are known adverse reactions. Bleeding requiring hospitalization is classified as Serious and Expected.

3. Carbamazepine: Stevens-Johnson syndrome (SJS) is a known serious skin reaction associated with carbamazepine. It is classified as Serious and Expected.

4. Amlodipine: Peripheral oedema (ankle swelling) is a common adverse reaction of amlodipine. It is classified as Non-Serious and Expected.

5. Ciprofloxacin: Tendon rupture is a known serious adverse reaction of ciprofloxacin and other fluoroquinolones. It is classified as Serious and Expected.

## Conclusion

Out of 5 ADR cases, 3 cases are Serious and 2 cases are Non-Serious. All 5 cases are classified as Expected based on known adverse drug reaction information.
